                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of predicting (the progression of) a toxic effect of a compound by preparing a gene expression profile of a toxic effect of a compound by preparing a gene expression profile to a database, or detecting the level of gene(s) gene expression in a tissue or cell sample exposed to the compound, where differential gene expression compared to a control indicates a toxic effect (toxicity progression). The method is useful for predicting (the progression of) at least one toxic effect of a compound. The genes are useful as toxicity markers in drug screening and toxicity assays. The methods are useful for predicting the likelihood that a compound or test agent will induce various specific kidney pathologies, such as nephritis, kidney necrosis, glomerular and tubular injury, or focal segmental glomerulosclerosis. The methods are useful for determining the similarity of a toxic response to one or more individual compounds and for predicting or endellating the potential cellular pathways influenced, induced or modelling the progression of renal disease states, for identifying genes that show promise as new drug targets and for screening known and newly compand drugs. This sequence corresponds to a gene marker used in the method of the invention. (Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences).

The present sequence is one of a large number of 5' ESTB derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   345

The invention relates to a purilied nucleic acid molecule associated with a cattle, and the LMFD nucleic acid can specifically hybridise to a second cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49347, or complements of them. Also included are (7 il a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonuclecides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising; (a) incubating a marker nucleic acid (complementary nucleic acid molecule obtained from the bovine cell or complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for the detection of the molecule. The LMFD nucleic acid is used for the complementary nucleic acid is used for the suseful for genome mapping, gene identification and analysis, cattle complements in the sequence tag) nucleic acide. Note: The for genetically improving cattle. The present sequence is one of the complement sequence was not shown in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention relates to a purified nucleic acid molecule associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid associated with lactation, and muscle and fat deposition, useful for genome mapping, gene identification and analysis, cattle breeding, or for genetically improving cattle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 89
                  Bovine; ss; EST; expressed sequence tag; lactation; LMFD; muscle deposition; fat deposition; genome mapping; gene identification; gene analysis; cattle breeding.

appearing as ABX34836-ABX49947, or complements of them. Also included are

i (1) a transformed cell having a nucleic acid comprising an LWFD nucleic
acid linked to a promoter and a 3' non-translated sequence that
functions in the cell to cause termination of transcription and addition
of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and
(2) determining a level or pattern of a molecule in a bovine cell or
tissue comprising: (a) incubating a marker nucleic acid (comprising any
of the 15112 nucleic acid sequences or its complement or fragment) with a
complementary nucleic acid permits the detection of the molecule; and (b)
complementary nucleic acid permits the detection of the molecule; and (b)
complementary nucleic acid permits the complementary nucleic acid, where
tissue, where hybridisation between the marker nucleic acid, where
complementary nucleic acid permits the detection of the molecule; and (b)
detecting the level or pattern of the complementary nucleic acid is used for
the detection of the molecule. The LMFD nucleic acid is used for
determining a level or pattern of a molecule in a bovine cell or tissue.
It is useful for genome mapping, gene identification and analysis, cattle
breeding, preparation of constructs for use in cattle gene expression, or
for genetically improving cattle. The present sequence is one of the
15112 'bovine LMFD BST (expressed sequence tag) nucleic acids. Note: The
present sequence was not shown in the specification but was obtained in
electronic format from the USPTO web site:

New human genome-derived single exon nucleic acid probes useful for huma gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 1; SEQ ID NO 26581; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids dequences concoling at least 8 amino acids of any of the 6888 amino acids dequences concoling at least 8 amino acids of any of the 6888 amino acids dequences ("Ily defined in the specification. The probe is a single exon probe that expressed in human cells or tissues. Also included are a spatially—adversable set of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid molecule expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality, a single exon microarray for measuring human gene expression, a method of probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above—mentioned amino acid sequences (optionally with conservative amino acids of contiguous amino acids of any of the above—mentioned amino acids or contiguous amino acids of any of the above—mentioned of providing methods of selling and/or licensing single exon probes or microarrays to contiguous amino acids of any of the above—mentioned of providing methods of selling and/or licensing single exon probes or microarrays to storage medium which contains a database having a plurality of records (ach record including data on the expression of a single exon probe cited above. The probes may be used as tools for surveying teach record including data on the expression of a single exon microarray. The probes may be used as tools for surveying teach record including data on the expression of a single exon probe of the probes may be used as tools for surveying transitive splicing events, in detecting and characterising growner of a single exon probe of the invention. 

Sequence 211 BP; 32 A; 85 C; 55 G; 39 T; 0 U; 0 Other;

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human

gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a vector comprising at least 8 probe cited above, an ORR-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acid substitutions), an

methods of selling and/or literating single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing human gene expression at a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probes med apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising gross alternations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              322
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ProLyslleGlnThrGlyLeuAspAlaThrHisAlaGluArgAlaIleProValSerArg 163

The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         335

                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The mucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisease DNA or RNA. The purified polypeptide is useful for generating antisbodies specific for it. The present sequence is useful for generating antisbodies specific for it. The present sequence for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                      New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR; for chromosome and gene mapping, in the recombinant production of protein, or in generating

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide expenses in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that cypressed in human cells or tissues. Also included are a spatially-expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human correct and addressable set of single exon nucleic acid probes is separately and addressably isolatable or amplifiable from the plurality), a single comparisor of measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid substitutions), and solated antibody that binds specifically to a peptide cited above, contended of sequences (optionally with conservative amino acid substitutions), and solated antibody that binds specifically to a peptide cited above, contended of sealling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing channan gene expression and a computer-readable contains a database having a plurality of records
                                                                                                                                                                                                  96 IleHisGlyLysHisAsnGluArgGlnAspAspHisGlyTyrIleSerArgGluPheHis 115
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

(each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising alternations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form art of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           206 CGGCTGTTCGACCAGTTTTTCGGCGAGGCCTTTTTGAGTATGACCTGCTGCTGCTTCCTG 265

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          303
                                                                                                                                                                                                                                                         The invention relates to a novel polypeptide comprising a heat shock protein 20-derived polypeptide. A polypeptide of the invention has cytostatic, antiarteriosclerotic, vasotropic, antianginal cerebroprotective, antiarrhyhmic, vasotropic, antianginal cerebroprotective, antiarrhyhmic, vasotropic, antianginal hypotensive, antimigraine, tocolytic, and relaxant activity, and may act as a HSP agonist or antagonist. The polypeptides, heat shock protein (HSP) 20, and methods are useful for treating or preventing a disorder, e.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy, ansospasm, which is associated with angina, coronary vasospasm, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, prinzmetal's angina, coronary ischaemia, stroke, bradycardia, toxemia of pregnancy, pre-term labour, pre-eclampsia, Raynaud's disease, Raynaud's phenomenon, haemolytic-uremia, non-occlusive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           73 cccessasscratrinsarcaacscritisscsassesriacresasscraarrascassa 132

The activity of polynucleotides of the invention may be described as, vulnerary, neuroprotective, immunomodulator, cytostatic and anti-inflammatory. Compositions comprising nucleic acids of the invention are useful for treating a mammalian subject, or as nutritional sources or supplements. These are useful in gene therapy, particularly for treating wounds, burns or ulcers, Alzheimer, disease, Huntington's disease, amyotrophic lateral sclerosis, autoimmune disorders, cancer or inflammation. The nucleic acids and polypeptides are also useful in diagnostic and research methods. The sequences given in records ABQ60789-ABQ61233 represent polynucleotides of the invention. NOTE: The sequence data for this parent did not form part of the printed specification, but

```
Isolated nucleic acid molecule encoding a channel/transporter protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid molecule encoding echannel/transporter protein or sequences at least 95% identical to a these. The nucleic acids and proteins encoded by them are used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 37; 809pp; English

rabbits, grads, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic mannoassays e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA) Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthitis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischemia, angiogenesis, nervous system disorders e.g. Alzhaimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemicaxis. The polypeptides can also be used and incompassed or decrease cure age capabilities. This sequence corresponds to a gene of the

This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are cleaning the generation of specific antibodies. (II) are used in a particular cleaning before comparison of expressed sequence tags) from a particular tissue type before comparison of expressed sequence this allows a cignificantly longer fragment of the gene to be revealed, and therefore reduces the number of failures because of ESTS from different libraries representing différent parts of the same unknown gene distorting the estimated frequency of occurrence in a particular tissue. AAZ41122-Z4248
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptides and their nucleic acids, useful for treatment of bladder tumor and identification of therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             library which encode the protein fragments represented in AAY60329-Y60591

The nucleic acids and proteins encoded by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility and a pathological somition or susceptibility to a pathological condition or susceptibility to a pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic

immunosseays e.g. radioimmunosseays or enzyme linked immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmunosorbent diseases e.g. radioimmunosseays or treated include autoimmune diseases e.g. rhumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease

```
MAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic, hepactoropic; vulnerary;
antiporiatic; antiparkinsonian; nootropic; neuroprotective; osteopathic;
antiporviant; antiparkinsonian; nootropic; neuroprotective; osteopathic;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
dermatological; immunosuppressaive; antidiabetic; hypotensive;
antiviral; antifungal; antihewmatic; antihercerial;
antiviral; antifungal; antihewmatic; antihercerial;
antiviral; antifungal; antihewmatic; antidiabetic; hypotensive;
sequences can be used for determining the presence of or predisposition
to, or preventing or treating pathological conditions associated with an
ORFX-associated disorder. The nucleic acids can be used to express ORFX
proteins in gene therapy vectors. The proteins and nucleic acids may be
used to treat cancers, proliferative disorders, neurodegenerative
disorders, osteoarthritis, graft vs host disease, cardiovascular disease,
diabetes mellitus, hypertension, hypothycidism, cholesterol ester
storage, systemic lupus erythematosus, severe combined immunodeficiency
(SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune
disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and
cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to
enhance coagulation; to inhibit thrombosis; and as a contraceptive

The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated DNA of the invention. The current sequence is not shown within the

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide expression, or their complements or fragments, and encoding at least 8 amino acid sequences fully defined in the specification, or their complements orid agequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-compressed in human cells or tissues. Also included are a spatially-compressed in human cells or amplifiable from the plurality, a single exon addressably isolatable or amplifiable from the plurality, a single comparison or measuring human gene expression, a vector comprising the single exon probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid contiguous amino acids of any of the above-mentioned amino acid solated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer destring to measure gene expression, a method of providing channal gene expression, and the expression and apparate of a storage medium which contains a database having a plurality of records (each record including data on the expression, and eccordant of a single exon probe content probes and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying contisues to detect the probes may be used as tools for surveying the addition, the probes are used in identifying and characterising exon microarrays. In addition, the probes are used in identifying and characterising and elementary expression in the indentity and a desired and element is all the expression in the expression and in constructing genemedative profession in desired and elementary expression in description, and a construc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polynucleotide comprising any one of 38043 CDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridistion). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences cure useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease DNA or RNA. The purified polypeptide is useful for generating antisease process. Sequences we sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

protein 20-derived polypeptide. A polypeptide comprising a heat shock protein 20-derived polypeptide. A polypeptide of the invention has cytostatic, antiarteriosclerotic, vasotropic, antianginal, correbroprotective, antiarrhythmic, antiasthmatic, gynaecological, hypotensive, antimigraine, tocolytic, and relaxant activity, and may act as a HSP agonist or antagonist. The polypeptides, heat shock protein (HSP) 20, and methods are useful for treating or preventing a disorder, co.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy, atherosclerosis, smooth muscle cell tumours such as laiomyosarcoma, or vasospasm, which is associated with angina, coronary vasospasm, coronary ischaemia, stroke, bradycardia, or prinzmetal's angina, coronary ischaemia, stroke, bradycardia, or hypertension, pulmonary (lung) hypertension, asthma (bronchospasm), toxemia of pregnancy, pre-term labour, pre-eclampsia/eclampsia, Raynaud's Gisease, Raynaud's phenomenon, haemolytic-uremia, non-occlusive corresponded in a polypeptide and HSP 20 are also useful for inhibiting smooth muscle cell profit is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              244 CATTITAGICCAGAAGAAATITCAGIAAAAGIAGIGGGAGACCAIGICCAGGIACAIGCT 303

The invention relates to a novel method of predicting at least one toxic effect of a compound. The method comprises a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database comprising at least part of the data or information given in the specification. The methods are useful for predicting at least one toxic effect of a compound, predicting the progression of a toxic effect of a compound, predicting the renal coxicity of a compound, or identifying toxicity markers in tissues or cells exposed tox known renal toxin. The genes are useful as toxicity markers in drug screening and toxicity wassays, in monitoring disease or physiological states, or disease progression. This polynucleotide represents a rat DNA sequence relating to the toxic effect database described in the specification. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electionic format directly from the World Intellectual Property
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Predicting at least one toxic effect of a compound, useful for toxicity modeling, comprises preparing a gene expression profile of a tissue or cell sample exposed to the compound, and comparing the gene expression profile to a database.

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide sequences, appearing as ABX34836-ABX49947, or complements of them. Also included are if it a transformed cell having a nucleic acid comprising an LMFD nucleic acid comprising and addition of polyadenylated ribonucleotides to a 3 end of the mRNA molecule, and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any of the late of the molecule, and the complementary nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or issue, where hybridisation between the marker nucleic acid and the detection of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the detection of the complementary nucleic acid is predictive of the complementary nucleic acid is predictive of the determining a level or pattern of a molecule in a bovine cell or tissue. The useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the complement when in the specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 71

An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or poly4RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used to obtain full length gene therapy and chromosome mapping procedures. They are used to obtain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                84 AspLeuThrValLysValGlnAspAspPheValGluIleHisGlyLysHisAsnGluArg 103

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH5081, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also clearmined by the technique of SBH (sequencing by hybridisation). Also circled is a purified polyapeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for inforensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense by an expense sequence data contained in electronic forma part of the printed specification, but was obtained in electronic format directly from USPTO at sequence. The sequence character sequence contained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynuclectide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 66
                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 1051, Application US/09513999C

Patent No. 6783961

GENERAL INORMATION:
APPLICANT: Dunes Milne Edwards, J.B.
APPLICANT: Duclert, A.
APPLICANT: Duclert, A.
TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.
Patent No. 6783961

FILE REFERENCE: 59 US2.REG

CURRENT APPLICATION NUMBER: US/09/513,999C

CURRENT FILING DATE: 2000-02-24

PRIOR APPLICATION NUMBER: US 60/122,487

PRIOR FILING DATE: 1999-02-26

NUMBER OF SEQ ID NOS: 36681

SOFTWARE: Patent.pm

SEQ ID NO 1051

Sequence 10502, Application US/09513999C

Patent No. 6783961

GENERAL INFORMATION:

APPLICANT: Dumas Milne Edwards, J.B.

APPLICANT: Ducalert, A.

APPLICANT: Giordano, J.Y.

TITLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PATENTE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PATENT: FILLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PATENT: FILLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PATENT: FILLE OF INVENTION: Expressed Sequence Tags and Encoded Human Proteins.

PATENT: PRICATION NUMBER: US/09/513,999C

CURRENT FILING DATE: 1999-02-26

NUMBER OF SEQ ID NOS: 36681

SOFTWARE: Patent.pm

SEQ ID NO 10502
